

**PATIENT**

Baby Drolshagen

**SPECIES**

Feline

**BREED**

Domestic Shorthair

**SEX**

Neutered male

**AGE**

15 years

**WEIGHT**

5 lbs

**INTERPRETED BY**

Remo Lobetti, BVSc,  
MMedVet (Med),  
PhD, Dipl. ECVIM

**IMAGING PERFORMED BY**

Kerri Becker

**HOSPITAL NAME**

Animal Paradise  
Hospital

**REFERRING VET**

Dr. ElShafie

**INVOICE**

73389

**DATE**

3/11/26

**PRESENTING CLINICAL SIGNS**

- HX IBD R/O abdominal neoplasia. Presence of mixed echogenicity mass or structure between intestinal loops
- K-3.1 TP-11.7 glob-9.1, HCT-27.5, FPL-abnormal, T4-16

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.5 cm, right measured 4.2 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

**Adrenal Glands**

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.38 cm in width. The right adrenal gland measured 0.34 cm in width.

**Spleen**

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.6 cm in width.

**Liver**

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

**Gallbladder**

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

***Gastrointestinal***

Normal appearance of the stomach, duodenum, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. Normal thickness of the small intestine with no loss of layering, but with a mild increase in the muscularis to mucosa ratio, normal peristaltic activity and no distension of the lumen.

***Pancreas***

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

***Free Abdomen***

Normal mesenteric lymph nodes.

No ascites evident.

Mottled echogenic, non-vascularized mass is noted in the midabdomen measuring 1.6 x 1.9 cm in size. This is not associated with any organ system.

**ULTRASONOGRAPHIC FINDINGS**

- Abdominal mass.
- Enteropathy.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Etiologies for the abdominal mass would be neoplasia and granuloma with possible organs of origin being a lymph node, pancreas and mesentery.

The enteropathy would be consistent with inflammatory bowel disease as per the patient's history.

Further assessment would be three view thoracic radiographs and FNA cytology of the mass. Specific therapy would be dependent on an etiological diagnosis.
