PRESENTING CLINICAL SIGNS

- Elevated ALP 95 and ALT 246
- Current Meds: Torb/Midaz sedation for scan

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. A scant amount of floating hyperechogenic sediment.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.1 cm, right measured 3.7 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.32 cm in width. The right adrenal gland measured 0.34 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.9 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. Thickening of the ileocecal junction (0.4 cm) with a hypoechoic appearance, but with no loss of layering. A moderate amount of ingesta was noted within the stomach and chyme was present in the proximal small intestine. This is compatible with a recent meal. Fecal material was present in the colon.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Enlarged mesenteric lymph nodes measuring up to 0.9 x 2.1 cm with an increased echogenic appearance, but maintained a normal shape.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Ileocecal thickening.
- Mesenteric lymphadenomegaly.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Etiologies for the ileocecal thickening would be granulomatous disease, inflammatory bowel disease and possibly emerging neoplasia.

Etiologies for the lymphadenomegaly would be reactive hyperplasia, lymphadenitis and infiltrative neoplasia.

Further assessment would be FNA cytology of the ileocecal junction, mesenteric lymph nodes and the liver.

Specific therapy would be dependent on an etiological diagnosis.
