PRESENTING CLINICAL SIGNS

- V+ w/ blood for past 2 days
- Current meds: Apoquel 8mg SID, Cerenia inj

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is small with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 6.1 cm, right measured 5.5 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

The prostate is small and hypoechogenic measuring 0.9 cm in width.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 1.74 cm in length x 0.62 cm and 0.51 cm in width. The right adrenal gland measured 2.0 cm in length x 0.4 cm and 0.74 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 1.9 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. Gas and a small amount of fluid is accumulating within the stomach. A small amount of fluid is present within the proximal duodenum and within a loop of small intestine.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Fluid accumulation within the stomach and small intestine.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Although the fluid accumulation may merely be an incidental finding and associated with acute gastroenteritis. A small gastrointestinal foreign body should still be considered.

Initial management would be to continue with the current therapy adding gastric protectants (Sucralfate, Omeprazole) and feeding small frequent meals of a low fat intestinal type diet.

Repeating the ultrasound after 18-24 hours would be recommended and if there is no improvement in either the clinical picture or the appearance of the small intestinal fluid accumulation, then a laparotomy should be considered as an obstructive foreign body may be present.
