

## PATIENT

Max Castellari

## SPECIES

Canine

## BREED

Bichon Frise

## SEX

Neutered male

## AGE

11 years

## WEIGHT

21 lbs

## INTERPRETED BY

Remo Lobetti, BVSc,  
MMedVet (Med),  
PhD, Dipl. ECVIM

## IMAGING PERFORMED BY

Vincent Ravancho, CVT

## HOSPITAL NAME

Farview AC

## REFERRING VET

Dr. Mosaad

## INVOICE

74674

## DATE

4/21/26

## PRESENTING CLINICAL SIGNS

History: Follow up from ER visit where possible diagnosis was hemangiosarcoma of liver or spleen. In-house rads WNL, no masses or tumors seen or palpated.

Abnormal PE/Chem/CBC/UA Results: Retic 124.2, WBC 17.20, Eos 2.3, Cholesterol 70

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.3 cm, right measured 4.7 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is noted.

The prostate is small and hypoechogenic measuring 0.7 cm in width.

### *Adrenal Glands*

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 1.45 cm in length x 0.42 cm and 0.36 cm in width. The right adrenal gland measured 0.38 cm in width.

### *Spleen*

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 1.5 cm in width.

### *Liver*

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

### *Gallbladder*

The gallbladder is small containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

**PATIENT**

Max Castellari

**SPECIES**

Canine

**BREED**

Bichon Frise

**SEX**

**Gastrointestinal**

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

**Pancreas**

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

**Free Abdomen**

Normal mesenteric lymph nodes.

No ascites evident.

Large, irregular, mottled echogenic, poorly vascularized mass in the caudal abdomen measuring 3.2 x 4.7 cm in size. The mass is not associated with any obvious organ system.

**ULTRASONOGRAPHIC FINDINGS**

- Abdominal mass.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Etiologies of the abdominal mass would be neoplasia, granuloma and possibly organized hematoma with possible organs of origin being a lymph node or the mesentery.

Further assessment would be three view thoracic radiographs and FNA cytology of the mass. Laparotomy should be considered as it could be both diagnostic and therapeutic with further specific therapy dependent on an etiological diagnosis.
