PRESENTING CLINICAL SIGNS

History: High CPL and R/O weight Loss. Hx of OA. X-Ray report: Unremarkable Thorax/Abdomen. Current Medication - Galliprant 100mg (1/4 SID), Gabapentin 100mg 1-2 Caps before bedtime, Trazodone 1 SID or as needed 50 mg. Abnormal PE/Chem/CBC/UA Results: CBC - WNL, Glu 69, CPL 516 High, T4 1.5

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is initially full, then empty with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.6 cm, right measured 4.9 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident.

The prostate is small and hypoechogenic.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 2.09 cm in length x 0.56 cm and 0.61 cm in width. The right adrenal gland measured 1.31 cm in length x 0.45 cm and 0.82 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. Focal, hypoechogenic, non-vascularized mass is noted in the head of the spleen with bulging of the overlying capsule evident. The mass measures 2.4 x 3.1 cm in size. The spleen measured 1.4 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Splenic mass.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The likely etiologies for the splenic mass would be hematoma, granuloma and neoplasia.

Further assessment would be echocardiography to evaluate the right atrium and right auricle and possibly FNA cytology of the splenic mass.

Splenectomy should be considered as it could be both diagnostic and therapeutic with further specific therapy would be dependent on an etiological diagnosis.

Monitoring of the glucose would also be recommended as it appears to be inappropriately low.
