PRESENTING CLINICAL SIGNS

Bella, a 11 month old Female Labrador Retriever, was presented to the Toronto Animal Health Partners Surgery Service for evaluation of a right pelvic limb lameness. Bella was initially noticed to be limping on the right pelvic leg for approximately 6 months. It started since 5 month of her age. The cause of the lameness seems likely due to right tarsal OCD. Bella was seen by Beaverton Crossroads Veterinary Services in August and was started on meloxicam which seemed to improve the lameness but now she has not on it any more. Rads were performed at that time, which revealed no concerns on hips and stifles, but possible effusion on the right tarsus. Orthopedic CT performed in Left lateral of Right tarsus. OCT 26th

Abnormal PE/Chem/CBC/UA Results: limping on the right pelvic leg for approximately 6 months. It started since 5 month of her age.

COMPUTED TOMOGRAPHIC FINDINGSRight Hind Limb

The right tarsal joint reveals a subchondral radiolucent defect of 8.4 mm with a prominent fragment and peripheral sclerosis of the medial talar ridge. There is moderate periarticular swelling recognized. Relevant secondary arthrosis is currently not recognized.

Displayed parts of the stifle, metatarsus and paw are inconspicuous.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Osteochondrosis dissecans of the right medial talar ridge with a large subchondral lesion and fragment.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

CT findings represent OCD of the medial talar ridge and do reflect the reported patient's history. Multiple fragments and relevant secondary degenerative joint disease are currently not recognized. Arthrotomy with extraction of the fragment is recommended.
