PRESENTING CLINICAL SIGNS

inappetence past 2 weeks, had molar trimming 2 weeks ago

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary system

The displayed structures of the urinary system appear normal. There is no evidence of uroliths or sediment. No evidence of an inflammatory or neoplastic process is noted.

Gastrointestinal

The colon is well filled and show hyperechoic feces. There is no overt evidence of an ileus, a florid-inflammatory or even neoplastic process as far as can be assessed.

Free Abdomen

There is no evidence of peritoneal or retroperitoneal effusion noted. The abdominal fat and great vessels show no pathological findings.

ULTRASONOGRAPHIC FINDINGS

- Normal abdominal sonogram

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Ultrasonographic findings of the abdomen do not match with the reported inappetence since there are no overt signs of a relevant inflammation (peritonitis/lymph adenomegaly, ...) or even a neoplastic process recognized. Final assessment of the gastrointestinal tract can be challenging due to the present amount of intestinal gas. Obstructive issues therefore cannot be fully excluded.

PATIENT

Flower MacInnes

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

SPECIES

Lagamorph

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance, please contact me.
