

## PATIENT

Aspen Kerwin

## SPECIES

Canine

## BREED

Retriever Mix

## SEX

Spayed Female

## AGE

5 Years

## WEIGHT

25.4 kg

## INTERPRETED BY

Sebastian Jawinski,  
German Board  
Certified Vet Specialist  
in Diagnostic Imaging

## IMAGING PERFORMED BY

BN

## HOSPITAL NAME

Bridgwater Veterinary  
Hospital & Wellness  
Centre

## REFERRING VET

Dr. Ainsley Dyson

## INVOICE

14332

## DATE

03/13/26

## PRESENTING CLINICAL SIGNS

- Gagging/sneezing symptoms-chronic-started Feb 2024.
- Partial benefit from antibiotics but recurs
- Sent Culture swabs away today-pending

## COMPUTED TOMOGRAPHIC STUDY OF THE HEAD & NECK

Pre/post contrast

## COMPUTED TOMOGRAPHIC FINDINGS

Both nasal cavities present an even and severe swelling of the mucous membranes without signs of an aggressive lesion. The bony borders of both cavities are intact and inconspicuous. The dental structures do not show particular findings. There is residual aeration on both sides with mild accumulations. The nasal exits are regularly ventilated. Radiopaque foreign material is not noted. Both frontal sinuses and the orbital contents are laterally symmetrical without evidence of a retro-/bulbar lesion.

The neurocranium shows normal findings. The bony structures of the skull and the skull foramina of the cranial nerves are laterally symmetrical and inconspicuous. Both tympanic bullae are completely ventilated with a regular tympanic bulla wall. The external ear canals are ventilated in all sections with inconspicuous walls.

The temporomandibular joints and the nasopharyngeal meatus have no particular findings.

Post contrast images show no pathological enhancement. The soft tissues of the head and neck are symmetrical and inconspicuous with mild enlargement of the cervical lymph nodes.

## COMPUTED TOMOGRAPHIC DIAGNOSIS

- Severe and unspecific signs of a bilateral rhinitis
- Mild cervical lymph adenomegaly

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Findings of the nasal cavities present an active inflammatory process and could be a chronic issue due to lympho-plasmocytic/eosinophilic inflammation/hyperplastic rhinitis with secondary infection. Sampling for cytology and microbiological testing are needed for further differentiation. Neoplasia is not suspected. Typical signs of a dental- or foreign material rhinitis are not detected. The enlargement of the lymph nodes is still consistent with reactive lymph adenitis.
