PRESENTING CLINICAL SIGNS

- Monoparesis on left hind limbs, CP deficits on left hind limb, UMN patella reflex on both hind limbs, right hind limb, no CP deficits
- no back pain was noted. thoracic limbs wnl.
- ataxic walking on both hind limbs, worst on the left hind limb, orthopedic examination on both hind limbs were unremarkable.

COMPUTED TOMOGRAPHY OF THE THORACIC & LUMBAR SPINE

CT myelogram provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

The presented spine shows a harmonic course with inconspicuous vertebral bodies. The bone density is within normal limits. There are no signs of a lytic or sclerotic process noted. The thoracolumbar and lumbosacral transition are unremarkable. There is no evidence of a fracture or subluxation. The intervertebral discs spaces are of even diameter and inconspicuous. As far as can be assessed, a compressive lesion is not recognized.

The paravertebral soft tissues are bilaterally symmetrical and inconspicuous. Unilateral atrophy of the paraspinal and/or pelvic musculature is not noted.

The displayed parts of the pelvis and coxofemoral joints are inconspicuous.

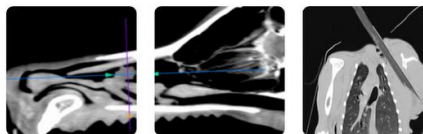

Thorax and abdomen do not show particular findings as far as displayed and can be assessed.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Normal findings thoracic and lumbar spine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT findings do not show a compressive lesion in the course of the spinal cord or cauda fibers. With that, the CT does not explain the reported patient's history. This does not exclude intramedullary lesions such as small edema or low-grade neoplasia or acute onsets like ANNPE or HNPE lesions /FCE/infarcts. These remain still potential differentials. As far as can be assessed, there is no indication for decompressive surgery.
