PRESENTING CLINICAL SIGNS

Chief Complaint: Right front paw pain with partial weight bearing following recent nail trimming and vaccination.

RADIOGRAPHIC FINDINGS

Front Paws

The displayed parts of the paws, metacarpal bones including the sesamoid bones and carpal joints are inconspicuous.

The medial contour of the distal radius presents an increased soft tissue opacity located in the course of the abductor pollicis longus tendon with a metaplastic calcification near to the medial styloid process.

There are no signs of abnormal sclerosis or osteolysis. There is no evidence of a fracture or subluxation.

Both elbow joints look normal with well-defined bone surfaces and without signs of a fracture, subluxation or an osteolytic/sclerotic process. The periarticular soft tissues are in expected normal limits.

Both shoulder joints are within normal limits.

RADIOGRAPHIC DIAGNOSIS

- Soft tissue swelling right medial carpal joint/medial styloid process.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The bony structures, especially of the distal forelimbs are inconspicuous. Signs of an aggressive lesion and/or osteolysis, a fracture or subluxation are not recognized. The soft tissue swelling on the medial aspect of the carpal joint could show an inflammatory issue as seen with bursitis/tendinitis of the abductor pollicis longus tendon. The metaplastic classification could represent an avulsion fragment or be due to chronic inflammation. This finding must be correlated with the clinical presentation (local pain?).
