

**PATIENT PRESENTING CLINICAL SIGNS**

**Finn Nickell** P was seen at a vet recently for urinary blockage about 1-2 months ago. P is very fractious. After the emergency visit, P had loss function of his tail. Will not raise tail, completely limp. Mild improvement in last week on gabapentin.

**SPECIES** Abnormal PE/Chem/CBC/UA Results: NSF

Feline

**RADIOGRAPHIC FINDINGS**

Spine/tail:

**BREED**

DSH

The presented spine shows a harmonic course with inconspicuous vertebral bodies. The lumbosacral transition is inconspicuous. There are no signs of a lytic or sclerotic process. There is no evidence of a fracture or subluxation. Calcification of the nuclei is not recognized. The intervertebral disc spaces are of even diameter. The tail shows no particular findings.

**SEX**

MN

Pelvis/coxofemoral joints:

**AGE**

7 Years

The bony structures of the pelvis and the sacroiliac joints are unremarkable. There is no evidence of a lytic process noted. Coxofemoral joints are inconspicuous. There is no relevant formation of osteophytes recognized. Femoral head/neck formations are unremarkable with a congruent joint space. There are no signs of a lytic or sclerotic process. There is no evidence of a fracture or subluxation.

**INTERPRETED BY**

Sebastian Jawinski,  
German Board  
Certified Vet  
Specialist in  
Diagnostic Imaging

**RADIOGRAPHIC DIAGNOSIS**

- Normal radiographic findings of the caudal lumbar spine/pelvis/coxofemoral joints, & tail

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Lesions of muscles/tendons or inflammatory changes of the soft tissues cannot be fully excluded as well as (lateral) compressive lesions of the spinal cord/the equine cauda. A further diagnostic step could be a tomography of the lumbar spine, lumbo-sacral transition, cranial tail including the intra-pelvic soft tissues.
