Diagnostic Imaging**HOSPITAL NAME**Myerscough  
Veterinary Group**REFERRING VET**

Claire Batty

**INVOICE**

47215

**DATE**

8-31-21

**PRESENTING CLINICAL SIGNS**

Intermittent lameness RIGHT fore, seems painful over elbow joint and some muscle atrophy on right fore

Abnormal PE/Chem/CBC/UA Results: NAD

**COMPUTED TOMOGRAPHIC FINDINGS**

The right elbow shows a marked incongruity of the radioulnar joint space. Mild formation of osteophytes at all parts of the joint is recognized. The medial coronoid process presents a large fragment of at least 4 mm with mild dislocation. There is increased density caudal to the process recognized. The correspondent subchondral surface of the trochlea is inconspicuous.

**COMPUTED TOMOGRAPHIC DIAGNOSIS**

- Lesion of the right medial coronoid process with fragmentation, joint incongruity and mild osteoarthritis consistent with canine elbow dysplasia

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

CT findings of the elbow joint are most likely relevant and regarding the clinical presentation surgery should be considered. The fragmented coronoid process/elbow dysplasia often is a bilateral finding.
