Zoey Geil

PRESENTING CLINICAL SIGNS

Dog presented 2/5/21 for mammary mass. Not spayed at this time. Chest films prior to surgery were clear. OHE and mammary mass removal done 2/25/21. Mass not sent for histopathology. Dog presented today (8/31/21) for another mammary growth. Chest films taken

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Lateral and vd views provided for review.

BREED

Labrador Retriever

RADIOGRAPHIC FINDINGS

The surrounding bony structures show marked and age-appropriate degenerative changes of the sternum, ribs and the thoracic spine. The extra-thoracic soft tissues present a cutaneous mass caudal to the xiphoid.

SEX

Spayed Female

The cardiac silhouette is normal without evidence of chamber enlargement.

AGE

13 Years

The lung density presents marked broncho-interstitial pattern with mineralized bronchial walls of the main stem bronchi and the bronchial tree. There is no evidence of focal/nodular lesions.

INTERPRETED BY

Sebastian Jawinski,
German Board
Certified Vet
Specialist in
Diagnostic Imaging

The trachea is unremarkable in diameter and course. The mediastinum presents expected soft tissue density, there is no evidence of tracheobronchial, cranial mediastinal or sternal lymphadenopathy. No mediastinal shift is seen.

The esophagus is not visible and considered to be normal. The diaphragm is unremarkable, no signs of pleural effusion.

RADIOGRAPHIC DIAGNOSIS

- Broncho-interstitial lung pattern with bronchial wall mineralization
- Mammary soft tissue mass caudal to the xiphoid

HOSPITAL NAME

Faithful Friends
Animal Clinic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**REFERRING VET**

Martha Rideout

The increase of interstitial lung density and bronchial wall mineralization are likely age-related and degenerative findings as well the changes of the thoracic spine, the ribs and the sternum. Currently, there is no evidence of pulmonary/mediastinal metastatic spread recognized.
