

PATIENT PRESENTING CLINICAL SIGNS

Chip St. Denis
 Chip, a 10 month old Male Neutered Chihuahua (long Coat), was presented for bilateral hindlimb lameness; right side more affected. The lameness was initially noticed at 3-4 months age. Lameness is progressively worsening and most notable after physical activity. Chip was on Gabapentin, but only had a mild effect. Chip currently exercising and going on water treadmill. Chip has had a previous history of: Right luxating patella, grade 1 Chip is currently eating dental food, with no history of allergies. Chip is UTD on vaccines
 Abnormal PE/Chem/CBC/UA Results: Right luxating patella, grade 1

BREED MAGNETIC RESONANCE IMAGING OF THE LUMBAR SPINE AND RIGHT HIND LIMB

Chihuahua
 T2 weighted, STIR, PD, T1 pre- and post-gadolinium sequence in multiple imaging planes are provided for review.

SEX MAGNETIC RESONANCE IMAGING FINDINGS

MN
 The osseous and soft tissue structures of the lumbar spine present no abnormalities. Post contrast administration, no pathological distribution of contrast media is appreciated.

The right coxofemoral joint and right stifle joint present a congruent joint space with smooth osseous margins and without signs for intracapsular swelling.

AGE
 10 Months
 The included musculature of the right hind limb and left hind limb presents with the expected signal behavior and without pathological contrast enhancement pattern.

INTERPRETED BY MAGNETIC RESONANCE IMAGING DIAGNOSIS

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

- Normal lumbar spine
- Normal hind limbs

HOSPITAL NAME INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Animal Health
 Partners

The MRI study of the lumbar spine, lumbosacral junction and the hind limb(s) presents without abnormalities explaining the presenting clinical signs. There is no evidence of compressive myelopathy, inflammation or changes of the pictured articular structures.
