

PATIENT

Moki Negarandeh

PRESENTING CLINICAL SIGNS

Limping RH leg for several weeks, having trouble going down stairs. No limping while walking.
Abnormal PE/Chem/CBC/UA Results:

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE PELVIS AND RIGHT STIFLE JOINT

A complete set of radiographs of the pelvis and the stifle joints is provided for review.

BREED

Bernadoodle

The growth plates are age related open.

S1 is not fused with S2.

The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present smooth osseous margins and congruent joint spaces.

SEX

Female Spayed

The periarticular bones of the right stifle joint present smooth osseous margins and without signs for intracapsular soft tissue swelling. The patella of both stifle joints is in situ.

RADIOGRAPHIC DIAGNOSIS

AGE

8 Months

- Symmetric lumbosacral transitional vertebra (type II)
- Normal pelvis and coxofemoral joints
- Normal right stifle joint

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study presents no abnormalities, explaining the right hind limb lameness. The clinical relevance of the lumbosacral transitional vertebra is unclear – it can be a predisposing factor for degenerative lumbosacral stenosis.
