**DATE**

1-12-22

**PRESENTING CLINICAL SIGNS**

Issues with left front leg started in September 2021. Will improve on NSAID, but when it flares up, Lolli will hardly walk around at home. No obvious lameness noted during exam in hospital, but very nervous dog in general in hospital setting.

Abnormal PE/Chem/CBC/UA Results: Sending some right FL comparison images. Shoulders/elbows/carpi. Change on medial aspect of distal radius/ulna + carpus (L leg)?

**RADIOGRAPHIC STUDY OF THE FRONT LIMBS**

A complete set of radiographs of the front limbs is provided for review.

**RADIOGRAPHIC FINDINGS**

Both shoulder joints present smooth osseous margins and the surrounding soft tissue structures are within normal limits.

The joint space of the elbow joints bilaterally is congruent, and the surface of the subchondral bone is smooth. The medial coronoid process of the elbow joints is well-defined. The soft tissue structures surrounding the elbow joints present without abnormalities.

The carpal joints present without abnormal findings of the osseous and surrounding soft tissue structures.

**RADIOGRAPHIC DIAGNOSIS**

- Structural normal front limbs bilaterally

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study of the front limbs is negative for pathology. Rule out pathology of the soft tissues, such as pathology of the bicipital tendon or rotator cuff injury. Pathology of the cervical spine or brachial plexus can be a source for lameness as well.

**PATIENT**

Lolli Beck

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
