

PATIENT

Farley
Mignano/Hagan

PRESENTING CLINICAL SIGNS

p lame on front left leg on/off for over 1-2 months. improves with rest. normal rom on exam in room, p very scared, o feels like p is sensitive to manipulation of carpi at home. head bob lame but not restricting his movement or ability to run and play currently.
Abnormal PE/Chem/CBC/UA Results: none done

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE FRONT LIMBS

A complete set of radiographs of the front limbs is provided for review.

BREED

Pitbull

RADIOGRAPHIC FINDINGS

The osseous and surrounding soft tissue structures of the left shoulder joint are within normal limits.

SEX

NM

Very mild osteophyte formation is seen at the cranial aspect of the radial head. The remainder of the osseous margins of both elbow joints are smooth. The contour of the medial coronoid process appears homogeneous in both elbow joints.

The carpal joints present smooth osseous margins. No pathological swelling is appreciated.

AGE

2 Years

The osseous and soft tissue structures of the front paws are within normal limits.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVCI

RADIOGRAPHIC DIAGNOSIS

- Mild osteophyte formation cranial aspect head of left radius
- Structural normal left shoulder joint
- Structural right elbow joint
- Structural normal carpal joints

HOSPITAL NAME

Grove Veterinary
Clinic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is equivocal mild osteophyte formation at the cranial aspect of the proximal head of the left radius which might be triggered by underlying elbow dysplasia (such as coronoid disease). Check if pain can be elicited by palpation of the left elbow joint supporting the diagnosis - if so, CT study of the elbow joints might be used as advanced diagnostic test.

REFERRING VET

Dr. Burton

Rule out pathology of the bicipital tendon or rotator cuff injury as source for pain as well.
