PRESENTING CLINICAL SIGNS

Intermittent non weight bearing on RH.
Abnormal PE/Chem/CBC/UA Results: Lameness on both RH and LH. Painful on both hips. Stifles palpate normally.

RADIOGRAPHIC STUDY OF THE PELVIS AND STIFLE JOINT

A complete set of radiographs of the pelvis and stifle joints is provided for review.

RADIOGRAPHIC FINDINGS

No abnormalities of the lumbosacral junction are appreciated. Both coxofemoral joints present moderate to marked osteophyte new bone formation with secondary misshapen femoral heads. The acetabular groove bilaterally is shallow, and the center of the femoral heads is lateral to the dorsal acetabular rim.

Both stifle joints present with smooth osseous margins and without signs for intracapsular soft tissue swelling.

RADIOGRAPHIC DIAGNOSIS

- Advanced degenerative osteoarthrosis coxofemoral joints bilaterally, due to hip dysplasia
- Normal stifle joints bilaterally

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The advanced degenerative joint disease of the coxofemoral joints is a plausible cause for the hind limb lameness. Consider empirical management ± intraarticular glucocorticoid application and professional physical therapy.
