

PATIENT PRESENTING CLINICAL SIGNS

Larry Karluk honking cough , came initially in January 1.2023,bloodwork was unremarkable , 3 views chest Radiographs was taken , sent home with Clavamox and Meloxicam , improved but once meds finished symptoms back worst that initially

SPECIES Abnormal PE/Chem/CBC/UA Results: today , very loud productive honking cough , no major abnormal sound over the lung fields, sent home with Baytril 10 mg/kg , a new radiographs was obtained today and both(first and 2nd studies) were sent for 2nd opinion

Canine

RADIOGRAPHIC STUDY OF THE THORAX

BREED A consecutive radiographic study of the thorax is provided for review. Radiographs are dated 1/1/23 and 1/17/23.

Bulldog English Mix

RADIOGRAPHIC FINDINGS

SEX Thorax 1/1/23

Male Neutered The vertebral endplates T4/T5 present ventral spondylosis formation. The costal cartilages present degenerative changes.

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

11 Years

INTERPRETED BY The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

Sebastian Schaub, DVM Dr. med. vet. DipECVDI The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

HOSPITAL NAME Generalized mild increased visibility of the bronchial walls is appreciated. The lung parenchyma presents a mild to moderate unstructured reticular pattern.

Lakeshore Woods Animal Hospital The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Thorax 1/17/23

REFERRING VET The radiographic changes are stationary in comparison to eh preceding radiographic study; no additional findings are appreciated.

Dr. Sam Masoud

RADIOGRAPHIC DIAGNOSIS

- INVOICE**
- Mild bronchial pattern with an interstitial component – stationary
 - Degenerative changes costal cartilages
 - Spondylosis deformans T4/T5
- 56219

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

DATE The consecutive radiographic study of the thorax presents a stationary mild broncho-interstitial lung pattern, suggestive for broncho-pneumonitis – such as canine infectious respiratory disease complex (CIRDC). Non-infectious causes such as allergic, eosinophilic, mixed bronchitis is a consideration as well. Prophylactic deworming appears beneficial to rule out parasitic infection. If
