

**PATIENT**

Raina Potthoff

PRESENTING CLINICAL SIGNS

Limping on left front intermittently for about a month.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE FRONT LIMBS

A complete set of radiographs of the front limbs is provided for review.

BREED

Weimaraner

RADIOGRAPHIC FINDINGS

Both shoulder joints present smooth osseous margins and the surrounding soft tissue structures are within normal limits. There is a mild increased cloudy opacity level with the intertubercular sulcus bilaterally, L>R.

SEX

Female

No abnormalities of the osseous and surrounding soft tissue structures of the elbow joints are appreciated.

The carpal joints present with a normal anatomy and without signs of periarticular swelling, unremarkable.

AGE

7 Years, 2 Months

RADIOGRAPHIC DIAGNOSIS

- Sclerosis intertubercular groove humerus bilaterally
- Normal elbow joints
- Normal carpal joints

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The sclerosis level with the intertubercular groove can be caused by pathology of the bicipital tendon, the findings are more pronounced in the left shoulder joint. Complementing workup by an ultrasound examination of the shoulder joint appears beneficial.

HOSPITAL NAME

Elizabeth Animal
Hospital

A CT study of the elbow joints can be used as advanced imaging modality, if pain can be localized on the elbow joints.
