

PATIENT

Camille Scheaffer

PRESENTING CLINICAL SIGNS

Local Housecall vets sent her to us for a work up: " We have a mutual patient named Camille, owned by Karen Neely and Steve Schaeffer. Camille has a recent history of intermittent bloody urine. Her urinalysis is normal except for the presence of red blood cells. She also has a history of chronic recurrent sinusitis. We would like Camille to have an abdominal ultrasound to evaluate her urinary system. Our main reasoning is to be sure she does not have evidence of cancer and/or cystic calculi. She is not symptomatic."
 Abnormal PE/Chem/CBC/UA Results: hematuria, culture neg, well concentrated pending cbc chem TT4

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in three imaging planes are provided for review.

SEX

FS

RADIOGRAPHIC FINDINGS

The thorax is only partially included within the collimation and assessment is very limited.

The vertebral endplates of the lumbosacral junction present moderate spondylosis formation.

AGE

11 Years

In the subcutaneous tissue dorsal to L2 to L5, multiple small gas inclusions are visible – suspect preceding injection.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

Northshore
 Veterinary Hospital

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas and small roundish mineral opaque bodies are seen within the small intestinal loops.

The colon is seen in the expected position and presents with appropriate content.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the abdomen presents without abnormalities, explaining the presenting clinical sign no abnormalities of the urinary tract are appreciated. Feline idiopathic cystitis might be a potential, non-radiopaque urinary calculi can be ruled out by an abdominal ultrasound examination.
