

PATIENT PRESENTING CLINICAL SIGNS

Luna Takhalov History: P is having a dark brown vaginal discharge. P is spayed. Hx of discharge dates back to July of 2022. At that time owner had reported a "fishy smell" and that the fluid was always clear.
Abnormal PE/Chem/CBC/UA Results:

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE ABDOMEN

A high resolution pre- and post-contrast CT study of the abdomen is provided for review.

BREED

Doberman

COMPUTED TOMOGRAPHIC FINDINGS

The serosal fat presents normal attenuation behavior. There is no evidence of peritoneal effusion or peritonitis.

SEX

Spayed Female

Both kidneys present within normal limits for size, shape and organ architecture. After contrast administration a bilaterally symmetric and uniform nephro- and pyelogram is noted. The urinary bladder presents with a thin and smooth wall. The ureters drain into the urinary bladder, cranial to the bladder neck. In the delayed post contrast study, contrast media is appreciated in the urethra and vaginal vestibule.

AGE

2 Years

The adrenal glands are within normal limits for size, shape and organ architecture.

Both liver and spleen present with normal shape, even surface, uniformly attenuating parenchyma and homogeneous contrast enhancement, unremarkable.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The portal vein presents a normal order of its tributary veins and intrahepatic branching. No abnormal vessel is noted inside and outside of the liver parenchyma.

HOSPITAL NAME

Mobile Pet Imaging

The pancreas is evenly contoured, the pancreatic parenchyma is homogeneous and presents uniform contrast enhancement.

In the stomach, a mineral attenuating, shell like body is visible, measuring 3.5 x 4.7 cm in size. The position, delineation, wall and content of the gastrointestinal tract are considered within normal limits throughout.

REFERRING VET

Dr. Meaux

The periarticular bones of the right coxofemoral joint present mild osteophyte new bone formation.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Contrast in urethra and vagina in the delayed post contrast phase
- Possible gastric foreign body

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

DATE

1/27/23

PATIENT Luna Takhalov
 The contrast media in the urethra and vaginal vestibule could indicate urinary incontinence, but there is no respective history. Retrograde administration of the contrast is a potential – no abnormalities of the contrast column – as well as mild incontinence secondary to general anesthesia.

SPECIES Canine
 The relevance of the gastric mineral attenuating body is unclear – if signs of vomiting develop, recommend follow up radiographs for recheck if the body is still present in the stomach. No additional abnormalities are appreciated, I do not appreciate remnants of the ovaries or other abnormalities.

BREED

Doberman

SEX

Spayed Female

AGE

2 Years

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
