RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The surrounding bony structures are within normal limits.
The extrathoracic soft tissues present homogeneous without abnormalities.
The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

HOSPITAL NAME

DPC Veterinary
Hospital

The cranial mediastinum is moderately widened by fat.
Mild dorsoventral flattening of the cervical tracheal segment is appreciated in the left lateral projection of the thorax. The luminal outline of the trachea is smooth.

REFERRING VET

Dr. White

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected. The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

INVOICE

20828

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

DATE

1/27/23

PATIENT

Pinky Sanchez

- Mild tracheal collapse

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

SPECIES

Canine

The radiographic study presents evidence of mild tracheal collapse with questionable clinical relevance.

No additional abnormalities of the thorax are appreciated.
