RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

A complete set of radiographs of the thorax and abdomen is provided for review.

RADIOGRAPHIC FINDINGS

SEX

FS

Thorax

Generalized moderate spondylosis formation is seen along the thoracic & lumbar spine. The costal cartilages present moderate degenerative changes.

AGE

12 Years

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

HOSPITAL NAME

Boca Park Animal Hospital

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

REFERRING VET

Spaulding

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Abdomen

INVOICE

49274

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

DATE

1-3-22

The liver is appropriate in position, size and presents uniform opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and

**PATIENT**

lower urinary tract.

Molly Marsh

The stomach is in its anticipated position and presents normal content.

SPECIES

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

Canine

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS**BREED**

Labradoodle

- Spondylosis deformans
- Degenerative changes costal cartilages
- History of splenectomy

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the thorax and abdomen presents without clinically relevant changes. An abdominal ultrasound examination might be used as advanced diagnostic tool for evaluation of the architecture of the abdominal parenchymal organs.
