

PATIENT

Brody Gabriele

PRESENTING CLINICAL SIGNS

Abd Mass and Bladder stones. Dog PU/PD and pollakiuria-- up Q 1-2 hours.
Abnormal PE/Chem/CBC/UA Results: AUS performed today and report expected Monday .
Concerned for splenic mass. Would like the 3 view chest rads/met check read out by radiologist.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

BREED

English Bulldog

RADIOGRAPHIC FINDINGS

Multiple hemivertebra are seen along the thoracic spine.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

SEX

MN

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

AGE

12 Years, 10 Months

In the VD projection, the intrathoracic segment of the trachea presents a mild right sided deviation – considered as a normal finding in brachycephalic dogs. The luminal outline of the trachea is smooth.

A generalized mild peribronchial cuffing is appreciated.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The lung parenchyma presents the expected architecture and generalized mild increased radiopacity due to an unstructured reticular pattern; the intrapulmonary vascular branching is seen up to the third order lung vessels.

HOSPITAL NAME

SVS Imaging Michigan

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

In the cranioventral abdomen, caudal to the stomach, a well-defined, roundish soft tissue opacity, measuring approximately 8 cm in diameter is appreciated.

REFERRING VET

Union Lake
Veterinary Hospital -
Dr. Marti Notarius

RADIOGRAPHIC DIAGNOSIS

- Bronchial lung pattern with interstitial component
- Multiple hemivertebra thoracic spine
- History of splenic mass

INVOICE

56039

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The broncho-interstitial lung pattern is suggestive for bronchitis and primary inflammatory non-infectious causes – such as lymphocytic plasmocytic, eosinophilic, mixed – and infectious causes (e.g. viral, bacterial, parasitic) need to be considered. As there is no history of cough, the clinical relevance of this finding is unclear.

DATE

1-6-23

There is no evidence of pulmonary metastatic disease.
