Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

BREED

Radiographs of the abdomen in three imaging planes are provided for review.

Pomeranian

RADIOGRAPHIC FINDINGS

The patella of the right stifle joint is superimposed on the medial femoral condyle.

SEX

In the subcutaneous tissue dorsal to L2/L3, the subcutaneous fat presents a focal soft tissue striation with interspersed small gas inclusions – suspect preceding subcutaneous injection.

Male Neutered

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

AGE

The liver is appropriate in position, size and presents uniform opacity.

5 Years

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

The stomach is in its anticipated position and presents normal content.

Truscott Animal Hospital

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

REFERRING VET

Medhat Meawad

RADIOGRAPHIC DIAGNOSIS

- Right sided medial patellar luxation
- Normal abdomen

49415

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is negative for pathology of the abdominal structures. Rule out intoxication, immune mediated disease, infection (or neoplasia) as causes for the potential hemolysis.
