

PATIENT PRESENTING CLINICAL SIGNS

Lucky Ferrigno History: limping LF .P3 digit sensitive grade 1/4 times 4 days ' equally painful digit number 4 . nails ok. No foreign body or interdigital moist dermatitis present.

SPECIES Abnormal PE/Chem/CBC/UA Results: blood pending

Canine **RADIOGRAPHIC STUDY OF THE LEFT FRONT PAW**

A mediolateral and dorsopalmar view of the left front paw are provided for review.

BREED RADIOGRAPHIC FINDINGS

King Charles

The abaxial sesamoid bone of the metacarpophalangeal joint of the second phalanx and the metacarpophalangeal joint of the 5th digit present mild osteophyte new bone formation. The soft tissue structures of the front paw are within normal limits, no evidence of swelling. A small exostosis is noted at the axial aspect of the distal diaphysis of the third metacarpal bone.

SEX

Neutered Male

A human finger is seen in the primary beam.

AGE RADIOGRAPHIC DIAGNOSIS

6 Years

- Mild degenerative osseous remodeling abaxial sesamoid bone metacarpophalangeal joint second phalanx left front limb
- Mild degenerative osteoarthritis metacarpophalangeal joint fifth phalanx left front limb
- Small exostosis axial aspect third metacarpal bone left front limb

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The current radiographic study of the left front paw presents without specific abnormalities explaining the left front limp lameness, but the mild degenerative changes of the metacarpophalangeal joint/sesamoid bone of the fifth and second phalanx.
