

PATIENT

Roseann Pignatere

PRESENTING CLINICAL SIGNS

History: Rescue from drug house. Age thought to be 5 years but not truly certain. Last normal this AM. Went to play with the kids early afternoon then came in lethargic and declined favorite treat. Tongue/gingival color reported pale initially. Rubbed right side of face with paw, knuckled RF paw. Looks better now. Can drink and eat small amount of food without vomiting.

SPECIES

Canine

Abnormal PE/Chem/CBC/UA Results: BCS 8/9, very brachycephalic, tongue pink to sl hue of purple. Too small oral cavity for that much tongue to assess retropharyngeal area. Difficult lungs to auscult over referred brachycephalic sounds but seem sl harsh bilaterally.

BREED

English Bulldog

RADIOGRAPHIC STUDY OF THE THORAX

A complete set of radiographs of the thorax is provided for review.

SEX

Spayed Female

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

A significant amount of subcutaneous fat is present.

AGE

5 Years

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum contains a moderate to marked amount of fat and is significantly widened.

The esophagus is mildly distended by gas.

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The trachea is normal in diameter and presents a mild right sided deviation in the VD projection – considered as normal variant in brachycephalic dogs, no evidence of overt mass effect. The luminal outline of the trachea is smooth.

HOSPITAL NAME

Blandford AH

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected. The lung parenchyma presents the expected architecture and generalized increased opacity of the lung field, due to the nutritional status; the intrapulmonary vascular branching is seen up to the third order lung vessels.

REFERRING VET

Russell LaPierre

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Obesity
