

**PATIENT PRESENTING CLINICAL SIGNS**

Winston Machin Second opinion for bony swelling medial aspect of Left carpal joint

COMPUTED TOMOGRAPHY OF THE FRONT LIMBS

SPECIES A high resolution pre- and post-contrast CT study of the carpal joints & front paws are provided for review.

Canine

COMPUTED TOMOGRAPHIC FINDINGS**BREED**

At the medial aspect of the left distal radius, in the region of the groove of the abductor pollicis longus muscle mild exostosis formation is appreciated. A focal moderate soft tissue swelling is seen level with the groove of the left abductor pollicis longus muscle.

French Bulldog

The periarticular bones of both carpal joints present smooth osseous margins, unremarkable.

SEX

The abaxial sesamoid of the second phalanx of both front paws is multipartite.

Neutered Male

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Exostosis formation distal aspect groove of left abductor pollicis longus muscle with associated soft tissue swelling
- Multipartite abaxial sesamoid bone metacarpophalangeal joint second phalanx bilaterally

AGE

4 Years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

A tenosynovitis of the left abductor pollicis longus muscle is considered most likely here. As there is no history of lameness, this is considered as an incidental finding. Recommend monitoring the region on a regular basis if the findings are stationary or progressive.
