

PATIENT

Maty Sieminski

PRESENTING CLINICAL SIGNS

Intermittent Hx of Pigmenturia - Noted more commonly after or at the end of urination

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

A right lateral view of the abdomen is provided for review.

BREED

Doodle

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Male Neutered

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin. Metal opaque surgical vascular clips are seen in the inguinal region.

AGE

6.75 Years

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is cropped by the collimation.

The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. A mineral opaque, roundish calculus with feathered margins is superimposed on the urinary bladder, measuring 1.6 cm in diameter.

The stomach is in its anticipated position and presents normal content.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Cystolithiasis

HOSPITAL NAME

Summit Dog & Cat
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The cystolithiasis is a plausible explanation for the described hematuria. Recommend complementing workup by complete urinalysis. Surgical management of the cystolith is considered as the therapy of choice. Consider radiographs of the caudal abdomen, including the entire course of the urethra to rule out additional calculi in the urethra.
