

**PATIENT**

Angel Meunier

**PRESENTING CLINICAL SIGNS**

Non-weight bearing on the F. R. Limb after jumping from high distance.  
Abnormal PE/Chem/CBC/UA Results: Pain signs while palpating and manipulating the carpal joint & the elbow.

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE RIGHT ELBOW JOINT**

Radiographs of the right elbow in two imaging planes are provided for review.

**BREED**

Bichon Frise X Poodle

**RADIOGRAPHIC FINDINGS**

A mild irregular roundish mineralized body is seen cranial to the proximal radial epiphysis, measuring 2 mm in size. The remainder of the elbow joint present smooth osseous margins. The surrounding soft tissue structures are homogenous and within normal limits.

**SEX**

Spayed Female

**RADIOGRAPHIC DIAGNOSIS**

- Roundish mineralization cranial aspect of right radial head

**AGE**

6 Years

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The rounded mineralization at the cranial aspect of the radial head is compatible with sesamoid bone of the supinator muscle or an osteophyte. There is no evidence acute bone injury. The presumptive diagnosis is contusion. If lameness persists under empirical therapy, stressed radiographs might be considered to rule out hyperextension syndrome of the carpal joint.
