RADIOGRAPHIC STUDY OF THE PELVIS

A ventrodorsal projection of the pelvis is provided for review.

RADIOGRAPHIC FINDINGS

The included osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present smooth osseous margins and congruent joint spaces.

AGE

3 Years, 6 Months

The volume of the soft tissue shadow of the musculature of the right hind limb is moderately decreased.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Disuse atrophy right thigh musculature
- Normal pelvis, no sign of hip dysplasia

HOSPITAL NAME

DPC Veterinary Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the pelvis presents without abnormalities, explaining the right hind limb lameness.

REFERRING VET

Dr. White

Given the clinical examination and signs of joint effusion and mild degenerative joint disease of the included right stifle joint, failure of the cranial cruciate ligament is considered as the cause for lameness here.
