

**PATIENT PRESENTING CLINICAL SIGNS**

**PATIENT** Bronn Doherty  
**SPECIES** Canine  
**BREED** Pug Mix  
 Ultrasound results- ultrasound results consistent with emphysematous Cystitis, need to be confirmed with abdominal radiographs, and recommended UA and Culture prominent Prostate with mineralization post prostatic urethra, correlate with pet age at neutering, passing urinary catheter to see if there any evidence of blockage nodule visualization within L adrenal gland- Relatively small and minimally defoms the caudal pole, no evidence of vascular invasion called O and explained results- discussed adrenal nodule- O declined any further diagnostics since been there since last Ultrasound and pet is clinically normal discussed Bladder and Cystitis and recommended bring for radiographs and passing urinary catheter to check for patency and UA, Urine culture and MIC explained in case of emphysematous Cystitis need to start on Abs depending on culture results - O will schedule  
 Abnormal PE/Chem/CBC/UA Results: CBC- WNL Diag- WNL UA, Culture and MIC o lab- Pending

**SEX RADIOGRAPHIC STUDY OF THE THORAX AND ABDOMEN**

**SEX** MN  
 Radiographs of the thorax in two orthogonal imaging planes and radiographs of the abdomen in a ventrodorsal projection are provided for review.

**AGE RADIOGRAPHIC FINDINGS**

**AGE** 11 Years  
Thorax

**INTERPRETED BY** The surrounding bony structures are within normal limits.

Sebastian Schaub, DVM  
 Dr. med. vet. DipECVDI  
 The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

**HOSPITAL NAME** The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.  
 Animal Paradise Hospital

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

**REFERRING VET** The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.  
 Dr. Elshafie

**INVOICE** The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

48033 The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

**DATE** Abdomen

10-27-21 The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and

**PATIENT**

thin.

Bronn Doherty

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

**SPECIES**

The splenic head is in the anticipated position and within normal limits for size and opacity.

Canine

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position and mild to moderately distended. The colon is superimposed on the urinary bladder in the lateral projection and a faint convex gas opacity is seen along the region of the dorsal urinary bladder wall.

**BREED**

Pug Mix

The stomach is in its anticipated position and empty.

**SEX**

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

MN

The colon is seen in the expected position and presents with appropriate content.

**AGE**

11 Years

**RADIOGRAPHIC DIAGNOSIS**

- Normal thorax
- Normal abdomen

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The current set of radiographs presents no specific abnormality. There is a faint gas opacity superimposed on the dorsal urinary bladder wall, but the fecal material is seen at the same level, and I consider the odds high that the gas is located within the feces and not the urinary bladder wall. A follow up radiograph of the abdomen can be considered if there is strong suspicion for emphysematous cystitis.
