

PATIENT PRESENTING CLINICAL SIGNS

PATIENT Linus Carmel History: Linus is a 8yr old mixed canine breed that presented for having sneezing and increased panting with R nasal discharge in early September 2021. Linus was put on antibiotic and steroid trial for the last month or so with no improvement. Linus will occasionally lick his right nostril continuously.

SPECIES Linus has serous drainage from the right nostril. Antibiotics have not helped.
Abnormal PE/Chem/CBC/UA Results:

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE SKULL

BREED A high resolution pre- and post-contrast CT study of the skull is provided for review.

Mixed **COMPUTED TOMOGRAPHIC FINDINGS**

SEX The tooth elements 311 and 411 are absent.

Neutered Male The nasal cavity presents the expected aerated spaces between thin and even conchae and turbinates with smooth mucosal lining. A mild mucosal swelling of the right maxillary recess is visible.

AGE Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

8 Years Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

INTERPRETED BY The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

HOSPITAL NAME The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

Critical Vet **COMPUTED TOMOGRAPHIC DIAGNOSIS**
Care/Suncoast Vet

- Mild mucosal swelling right maxillary recess
- Otherwise, structural normal skull

REFERRING VET INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Dr. Young The mild swelling of the right maxillary mucosal lining is suggestive for mild inflammation. No additional abnormalities are appreciated explaining the described clinical signs. The presumptive diagnosis is non-specific rhinitis – e.g., lymphocytic plasmocytic, eosinophilic. Rhinoscopy with sampling for biopsy and microbial culture might be performed as advanced diagnostic tests.
