

PATIENT PRESENTING CLINICAL SIGNS

Lilley O'Donnell History: Patient initially presented in July for intermittent LRL lameness for one month duration. Per owner patient fell off bed a month prior Owner reports patient still shows intermittent lameness in the LRL

SPECIES

Abnormal PE/Chem/CBC/UA Results: PE: Intermittent weight bearing LRL lameness; grade 2/4 MPL (L), 1/4 (R); painful on extension of hips in July; no pain elicited on 10/02/21

BREED

Chihuahua

RADIOGRAPHIC STUDY OF THE STIFLE JOINTS

Radiographs of the stifle joint in two imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

SEX

Spayed Female

A mild ill-defined radiolucent zone is visible in the caudoproximal aspect of the tibial tuberosity. The patella of the left stifle joint is superimposed on the medial aspect of the medial femoral condyle.

RADIOGRAPHIC DIAGNOSIS

AGE

2 Years

- Left sided medial patellar luxation
- Retained cartilage core tibial tuberosity bilaterally

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The left sided medial patellar luxation is fitting the history and can be a source for intermittent lameness. No additional abnormalities of the stifle joints are appreciated. Based on the findings of the orthopedic examination, surgical intervention might be beneficial.

HOSPITAL NAME

Sunset AH

The retained cartilage core of the tibial tuberosity has been reported to be associated with a higher incidence of medial patellar luxation.
