

PATIENT

Max Tee

PRESENTING CLINICAL SIGNS

Intermittent lameness right hind, unsure of which leg as intermittent lameness when walking, luxating patellas, please look at bilateral hind limbs and pelvis.
Abnormal PE/Chem/CBC/UA Results: NAD

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE PELVIS AND HIND LIMBS

A high resolution plain CT study of the pelvis and hind limbs is provided for review.

BREED

Boston Terrier

COMPUTED TOMOGRAPHIC FINDINGS

The growth plates are age related open.

The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present smooth osseous margins and congruent joint spaces. Breed related malformation of the caudate spine is noted.

SEX

Male

The periarticular bones of the stifle joints and left tarsal joints present smooth osseous margins and without signs of pathological intracapsular swelling. The patella is bilaterally in situ.

The soft tissue structures of the hind limbs present without abnormalities.

AGE

10 Months

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Normal pelvis
- Normal hind limbs

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The current CT study of the pelvis and the hind limbs presents without abnormalities, explaining the hind limb lameness. Rule out that the clinically appreciated patellar luxation is the underlying cause for the presenting clinical signs.
