

PATIENT PRESENTING CLINICAL SIGNS

Sydney Beute History: sporadic Left front leg lameness, Holds up and vocalizes. R/o elbow dysplasia or tendinitis
Abnormal PE/Chem/CBC/UA Results:

SPECIES RADIOGRAPHIC STUDY OF THE FRONT LIMBS

Canine Radiographs of both front limbs in a mediolateral and craniocaudal view are provided for review.

BREED RADIOGRAPHIC FINDINGS

Bernese Mt. Dog Mix Both elbow joints present smooth osseous margins. The contour of the medial coronoid process is well-defined and presents a uniform density. The surrounding soft tissue structures of the elbow joints are within normal limits.

SEX The distal aspects of both front limbs are within normal limits.

Spayed Female

RADIOGRAPHIC DIAGNOSIS

- Normal elbow joints bilaterally

AGE

1 Year

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The current set of radiographs of the front limbs is negative for disease, there are no radiographic signs for elbow dysplasia. If the clinical examination is concerning for disease of the medial coronoid process – such as pain on pressure on the medial compartment of the elbow joint – cross-sectional imaging should be considered. Rule out pathology of the shoulder joints as source for the intermittent lameness as well.
