

PATIENT

Gus Gus Fatolitis

PRESENTING CLINICAL SIGNS

Reason for Visit: attempting to urinate but only dribbling History: 9 y 8 m beagle mix presented for sqatting to pee nut only dribbles coming out . peed sucessfuly today. Went to saint francis over night they took x rays and stated they saw no stones. pet has had stones in the past. Doctor there suggested they may be invisible. Pet did vomit 1 x yesterday.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in three imaging planes are provided for review.

BREED

Beagle Mix

RADIOGRAPHIC FINDINGS

The vertebral endplates L7/S1 present moderate spondylosis formation. The periarticular bones of the right coxofemoral joint present moderate osteophyte new bone formation.

SEX

SF

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal space. Ventral to L5 to L7 a mild increased fusiform shaped soft tissue opacification is noted.

AGE

9 Years, 8 Months

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position and empty. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and presents normal content.

HOSPITAL NAME

DPC Veterinary
Hospital

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

REFERRING VET

Dr. Oldenhoff

- Focal sublumbar increased soft tissue opacity
- Empty urinary bladder
- Degenerative osteoarthritis right coxofemoral joint
- Spondylosis deformans L7/S1

INVOICE

54906

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The caudal soft sublumbar soft tissue opacification is likely a sequela to superimposition with overlying soft tissue structures and no overt mass effect is appreciated. However, lymphadenopathy of the medial iliac lymph nodes or focal mild effusion/hematoma formation should be ruled out by rectal exam ± abdominal ultrasound examination.

DATE

11-1-22

The urinary bladder is empty, and no radiopaque calculi are appreciated. However, to rule out non-radiopaque calculi or intramural mass, an ultrasound examination would be beneficial.
