

PATIENT

Lottie Richardson

PRESENTING CLINICAL SIGNS

Annual exam, lump on thigh changed in size/ texture per O (Sept 2022)
 Abnormal PE/Chem/CBC/UA Results: Grade 3/6 systolic heart murmur, multiple dermal masses to be removed surgically. Mild ALP elevation, normal proBNP

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

A complete set of radiographs of the thorax and abdomen is provided for review.

BREED

Weimaraner

RADIOGRAPHIC FINDINGS

Thorax

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

SEX

FS

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE

10 Years

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

HOSPITAL NAME

Northshore
 Veterinary Hospital

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Abdomen

The surrounding bony structures are within normal limits.

REFERRING VET

Brita Kiffney

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

INVOICE

55098

The hepatic volume is mildly increased and the caudoventral margins are rounded. The liver has a homogeneous soft tissue opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

DATE

11-10-22

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and presents normal content. In the right lateral view, a roundish soft tissue opacity is seen at the ventrocaudal aspect of the stomach that is considered

PATIENT

Lottie Richardson

as the pylorus.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

SPECIES

Canine

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Mild hepatomegaly
- Normal thorax, no evidence of pulmonary metastatic disease

BREED

Weimaraner

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Potentials for the hepatomegaly include metabolic hepatic disease/steroid induced hepatopathy, hepatitis or neoplastic infiltration. Ultrasound including FNA sampling can be used as minimally advanced diagnostic tests.

SEX

FS

The roundish soft tissue opacity seen at the caudoventral aspect of the stomach in the right lateral view is very likely the pylorus. In case of doubt, recommend complementing workup by an abdominal ultrasound examination to rule out splenic, pancreatic or pedunculated hepatic mass entirely.
