PRESENTING CLINICAL SIGNS

Suspected broken mandible due to an unknown cause at home. P is unable to close their mouth and is bleeding. Tooth 404 avulsed during the exam

COMPUTED TOMOGRAPHY OF THE SKULL

A high resolution pre- and post-contrast CT study of the skull is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

Triadan 404 is absent, and gas is appreciated in the respective empty alveolar crest. The rostral segment of the mandible bilaterally is fractured with an oblique fracture line running through the alveolar crest of triadan 304 and 404 and the rostral segment including the incisor teeth and 304 is dislocated rostroventrally.

The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Acute traumatic bilateral rostral mandibular fracture – in the alveolar crest of the mandibular canine teeth – with mild rostroventral deviation
- Avulsion of triadan 404

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Management of the mandibular fracture – either surgically or using a dental splinting system – is recommended.
