

PATIENT PRESENTING CLINICAL SIGNS

Moose Carroll
vomiting since yesterday, may had eaten plastic
Abnormal PE/Chem/CBC/UA Results: blood work unremarkable

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine
Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and is empty.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content with a moderate amount of gas.

RADIOGRAPHIC DIAGNOSIS

- Empty stomach

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The empty stomach is likely a sequela to the vomiting. There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction. The presumptive diagnosis is gastritis. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases, a high ileus may lack classical radiographic signs of mechanical obstruction.
