Feline

RADIOGRAPHIC STUDY OF THE ABDOMEN

BREED

Radiographs of the abdomen in three imaging planes are provided for review.

Domestic Shorthair

RADIOGRAPHIC FINDINGS

SEX

The patient presents with lean body condition with secondary reduced serosal detail, due to limited amount of serosal fat.

Male Neutered

The surrounding bony structures are within normal limits.

AGE

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

14 Years

The liver is appropriate in position, size and presents uniform opacity.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

HOSPITAL NAME

St. Catherine's Animal
Hospital

Both kidneys are seen and present with normal size, shape, delineation and opacity. A small mineralized body is seen in the imaging plane of the renal pelvis of likely the right kidney. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the lower urinary tract.

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

REFERRING VET

Dr. Masoud

The colon is seen in the expected position and contains a moderate amount of gas and foamy fecal material

RADIOGRAPHIC DIAGNOSIS

INVOICE

48407

- Reduced body condition score
- Suspect nephrolithiasis right kidney
- Gas distended colon, no evidence of constipation

DATE

11-16-21

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The findings are not specific, but the reduced body condition score can be a sequela to chronic hyporexia. Complementing workup by an abdominal ultrasound examination can be used for further evaluation of architecture of the abdominal organs.
