

**PATIENT**

Tali O'Marra

**SPECIES**

Canine

**BREED**

German Shepherd  
Mix

**SEX**

Female Spayed

**AGE**

2 Years

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

**HOSPITAL NAME**

St. Catherine's Animal  
Hospital

**REFERRING VET**

Dr. Masoud

**INVOICE**

48397

**DATE**

11-16-21

**PRESENTING CLINICAL SIGNS**

had history of swollen neck , gagging , swallowing his saliva on/off but no vomiting  
Abnormal PE/Chem/CBC/UA Results: mild to moderate swollen submandibular lymph nodes, laryngeal area , ear erythema and brown discharge right>left , bloodwork unremarkable except low phosph., potassium , mild dehydration , rest is normal including CPLI, suspected laryngeal FB vs megaesophagus vs trauma .

**RADIOGRAPHIC STUDY OF THE NECK AND THORAX**

Radiographs of the thorax, including the neck, in three imaging planes are provided for review.

**RADIOGRAPHIC FINDINGS**

The osseous and soft tissue structures of the neck are within normal limits.

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

**RADIOGRAPHIC DIAGNOSIS**

- Normal thorax and neck
- No evidence of megaesophagus

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study of the neck and thorax presents no abnormalities. There is no evidence of esophageal foreign body or megaesophagus.
