PRESENTING CLINICAL SIGNS

Nico presents today for metastatic screening in preparation for surgical removal of a spindle cell proliferation with atypia located on the muzzle. Patient has a history of previous neoplastic mass removals. No lymphadenopathy is noted on exam, and there are no current clinical signs of concern. Problem List / Relevant History: Chin mass – r/o MCT vs. other Left forelimb mass – previously FNA'd as benign; recently decreased slightly in size with hair regrowth OA/DJD History of cancerous mass removals by Dr. Carey at ACCESS (right caudal thigh and left ventral thoracolumbar region); no reported regrowth Grade 3 dental disease Physical Examination: Integument: 0.5 cm pink, hairless, soft lesion on the left lateral caudal mandible; 2.5 cm red, raised dermal mass on the left forelimb; multiple variably sized subcutaneous and dermal masses; wide, well-healed surgical scars at the right caudal thigh and left ventral thoracolumbar region; otherwise full haircoat Oral Cavity: Limited oral exam; focal heavy tartar with associated gingivitis; no halitosis Lymphatics: Peripheral lymph nodes symmetrical and normal in size Cardiovascular: Regular rhythm; no murmurs auscultated

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The body condition score is 7/9.

Along the thoracic spine, multifocal spondylosis formation is seen.

The periarticular bones of one elbow joint present moderate osteophyte new bone formation.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape; there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Obesity
- Osteoarthritis one elbow joint
- Spondylosis deformans

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the thorax reveals no evidence of pulmonary metastatic disease.
