DipECVDI

## IMAGING PERFORMED BY

Hazel Holman VMD

## HOSPITAL NAME

Blandford Animal  
Hospital

## REFERRING VET

Hazel Holman VMD

## INVOICE

72674

## DATE

11-19-25

## PRESENTING CLINICAL SIGNS

Hx dry heaves/retching for 2 mo. Hyporexic. Wt loss Active (case worked up by different doctor, this cut and paste from record)

Abnormal PE/Chem/CBC/UA Results: PE was entered as NSF

## RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in two image planes are provided for review.

## RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape; there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

In the medial aspect of the left caudal lung lobe, an ovoid shaped, a soft tissue opaque mass with interspersed gas inclusion is visible; measuring 2.6 x 4.8 x 3.0 cm.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

## RADIOGRAPHIC DIAGNOSIS

- Soft tissue mass left caudal lung lobe

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The soft tissue mass originating from the left caudal lung lobe is highly concerning for primary pulmonary neoplasia – carcinoma is most common. A differential is a zone with pyogranulomatous pneumonia. Ultrasound guided FNA sampling using a dorsal approach via the 9<sup>th</sup> left intercostal space can be tried for specification. If surgical management is an option, workup can be complemented by a CT study for surgical planning.
