PRESENTING CLINICAL SIGNS

p presented for chronic intermittent R forelimb lameness, exacerbated by rough play. First seen 9/5/2022 at ER clinic. Incomplete response to exercise restriction + NSAID therapy x 2 weeks. Abnormal PE/Chem/CBC/UA Results: PE: p does not care for all limbs being manipulated- this seems behavioral. Consistent click with extension and pronation of R shoulder. No other orthopedic abnormalities found. No apparent lameness during exam. Afebrile. Excellent energy, good lean BCS with no muscle atrophy.

RADIOGRAPHIC STUDY OF THE SHOULDER JOINTS

Radiographs of both shoulder joints in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

There is a breed specific chondrodystrophic conformation of the skeletal structures.

Both shoulder joints present smooth osseous margins and the surrounding soft tissue structures are within normal limits.

RADIOGRAPHIC DIAGNOSIS

- Chondrodystrophic conformation of the skeletal structures
- Normal shoulder joints

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the shoulder joints presents without abnormalities. Ultrasound can be used for further evaluation of the bicipital tendon – including dynamic exam – and ruling out rotator cuff injury. Check clinically if signs of instability of the shoulder joints are present.

PATIENT

Fern Safko

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
