PRESENTING CLINICAL SIGNS

had a surgery (neuter) a week ago, owner noticed that the lower jaw became crooked, not eating and vomited once today

Abnormal PE/Chem/CBC/UA Results: mild swelling at the left JMJ area was noticed under sedation, no bruises or abnormal discharge noticed, Xray was sent to evaluate the TMJ and what is the next step of the treatment?

RADIOGRAPHIC STUDY OF THE SKULL

Radiographs of the skull in multiple imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

There is marked brachycephalic conformation of the skull.

The calvarium has a dome shaped conformation.

The frontal sinuses appear asymmetric with bulging of the right frontal sinus.

No additional abnormalities are appreciated.

RADIOGRAPHIC DIAGNOSIS

- Brachycephalic conformation of the skull
- Dome shaped calvarium
- Suspect asymmetric conformation of the frontal sinuses

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Unfortunately, the radiographs are not diagnostic for the evaluation of the temporomandibular joints – recommend complementing the radiographic study by a well positioned dorsoventral projection or a CT study of the skull, in case of suspicion for pathology of the temporomandibular joints.

The dome shaped calvarium can be a normal anatomical variant or is a sequela to hydrocephalus.
