MAGNETIC RESONANCE IMAGING FINDINGS

Head

The brain presents the expected anatomy and bilateral symmetry with normal signal intensity and contrast enhancement. There is no evidence of abnormal meningeal enhancement.

SEX

MN

The ventricular system presents the expected dimensions, morphology and the CSF signal is within normal limits in all sequences.

AGE

6 Months

The ocular bulbs bilaterally are absent. The soft tissues in the orbit bilaterally present a focal T2 mixed hyper- to hypointense signal pattern.

The tympanic bullae are aerated, and the bony lining is thin.

Surrounding soft tissue structures in the head region are within normal limits.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

MAGNETIC RESONANCE IMAGING DIAGNOSIS

- History of bilateral enucleation of the ocular bulbs
- Normal brain

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

In the present study of the brain there is no evidence of macromorphological disease, supporting the presumptive diagnosis of idiopathic epilepsy.

If not yet done so the workup should be complemented by complete bloodwork to screen for brain disease that is not necessarily associated with structural changes of the brain parenchyma and rule out hepatoencephalopathy and other systemic illness.
