

PATIENT

Congo Kushner

SPECIES

Avian

BREED

African Grey Parrot

SEX

Male

AGE

23Y

WEIGHT

0.35kg

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet.
DipECVDI

IMAGING PERFORMED BY

Joseph D'Abbraccio,
DVM

HOSPITAL NAME

Catskill Veterinary
Services, PLLC

REFERRING VET

Gina Vecere, DVM,
DACEPM

INVOICE

72741

DATE

11-24-25

PRESENTING CLINICAL SIGNS

3/23/2025: Owner brought in the patient today wanting to get better management of the patient's seizures. The patient's seizures are sporadic; the patient can go 3 weeks without having a seizure, and then other times can have 2 in one day. The owner has been managing at home with organic turmeric and cayenne pepper since 2017. The patient did experience a 4 and a half year gap with no seizure episodes. The seizures usually only last about a minute. 11/24/2025: Congo presents today for Whole Body CT. Any Abnormal Behavior?: Yes: Seizure like activity. Last episode was 2-3 weeks ago. Abnormal PE/Chem/CBC/UA Results: PE: Feathers: Abnormal: Mild feather barbering on primary wing feathers CBC: HCT 58; Heterophils 36; Monocytes 11; Chem: AST 92; Phosphorus 2.1; Sodium 160;

COMPUTED TOMOGRAPHY OF THE COELOMIC CAVITY

A high resolution pre- and post-contrast CT study of the coelomic cavity is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

The cardiovascular structures including the pulmonary vasculature are within normal limits.

The bronchial tree presents with regular branching and tapers uniformly towards the periphery as expected, the bronchial walls are thin and smooth. The bronchus-to-artery ratio is within normal limits.

The lung parenchyma presents the expected architecture and attenuation behavior.

Both kidneys present within normal limits for size, shape and organ architecture. The testicles are normal in size and shape.

The liver presents with normal shape, even surface, uniformly attenuating parenchyma and homogeneous contrast enhancement, unremarkable.

The proventriculus and ventriculus are subjectively mildly prominent. The position, delineation, wall and content of the intestinal tract are considered within normal limits throughout.

The bony and surrounding soft tissue structures reveal no abnormalities.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Subjective prominent proventriculus & ventriculus

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The prominent proventriculus and ventriculus are likely may be an incidental finding and the odds for inflammatory origin such as proventriculitis and ventriculitis are high – theoretically proventricular dilation disease would be a differential, but the duration of clinical signs is unusual. No additional abnormalities are appreciated that do explain the seizure activity.
