

**PATIENT**

Charlie McCambridge

PRESENTING CLINICAL SIGNS

vomited 6 times yesterday and once today, owner feed a small amount of popcorn. unsure if there has been access to foreign bodies.

Abnormal PE/Chem/CBC/UA Results: tense abdomen, blood work pending.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in three imaging planes are provided for review.

BREED

Yorkshire Terrier

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

SEX

Neutered Male

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

4 Years

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and contains a mild amount of fluid.

HOSPITAL NAME

Truscott Animal
Hospital

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and contain appropriate content.

REFERRING VET

Medhat Meawad

RADIOGRAPHIC DIAGNOSIS

- Mild fluid pattern of the stomach

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The mild fluid pattern of the stomach is concerning for underlying gastritis. There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction. Recommend empirical management. If clinical signs are refractory to therapy, recommend follow up radiographs (after 12h of fasting) or a complete abdominal ultrasound examination; in some cases, a high ileus may lack classical radiographic signs of mechanical obstruction.
